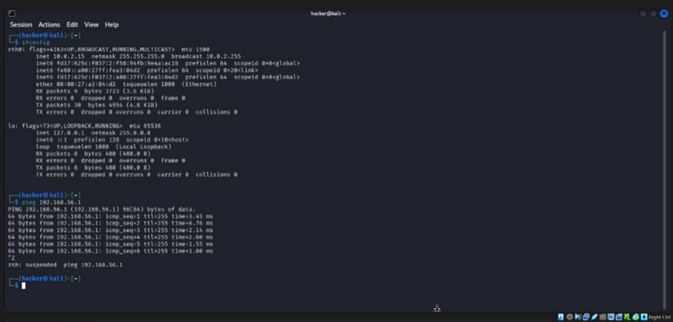
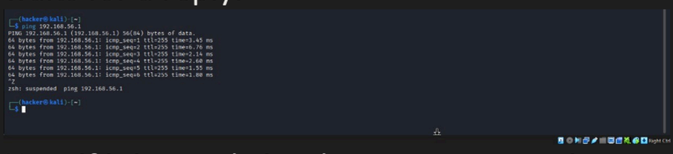
1. First check for the ip address of windows machine and kali Linux.

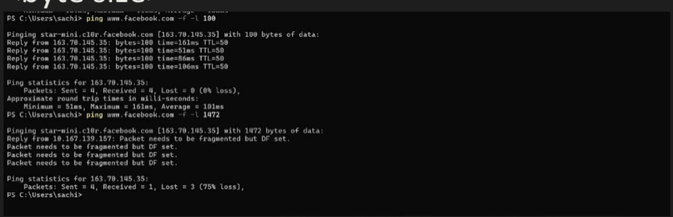


2. To check if an IP address is reachable or not. Using command: ip <ip address>
3. It sends ICMP echo packets to the target and waits for a reply.



4. Now if it is a website then we can use ping <target website>

5. As we can see that by default packet size is 32.
6. Now we have to check for the maximum packet byte size.
   using command: ping www.facebook.com -f -l <byte size>



7. To find the route between you and the website and to find from where all the information is travelling we can use command: tracert <website>
