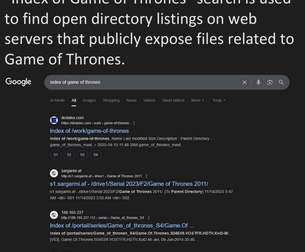
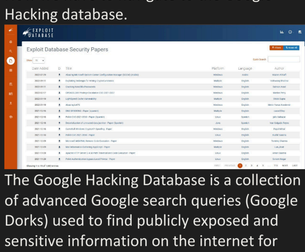
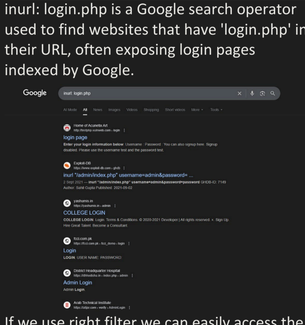
Roll No.	2401921520233

1. Attackers sometimes use Google search during prompt engineering attacks to gather information that helps them trick or manipulate AI systems. This is not hacking Google – they simply use Google for collecting publicly available data.
2. If we search games of thrones on Google search engine the output will be

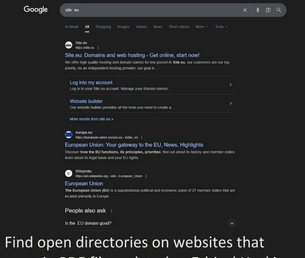


3. If we use command: index of game of thrones the result will different.
4. "Index of Game of Thrones" search is used to find open directory listings on web servers that publicly expose files related to Game of Thrones.





5. Now we have to navigate to the Google Hacking database.



6. The Google Hacking Database is a collection of advanced Google search queries (Google Dorks) used to find publicly exposed and sensitive information on the internet for cybersecurity research.
7. Here you can see list of vulnerabilities.

8. inurl: login.php is a Google search operator used to find websites that have 'login.php' in their URL, often exposing login pages indexed by Google.

9. If we use right filter we can easily access the website.
   It will contain all the sites of the eu.

10. Find open directories on websites that contain PDF files related to Ethical Hacking.
