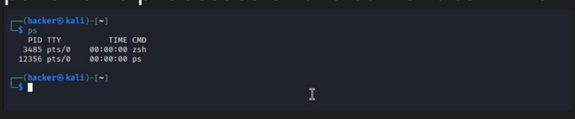
Name	Saurabh Singh
Section	CSAI 4
Roll No.	2401921520233

WHAT IS A PROCESS?
A process is any program or command that is currently running on the system.
Examples:
When you run nmap, it becomes a process.
When you open Firefox, it becomes a process.
System services (like networking) run as background processes.

1. ps- Shows processes of the current terminal.

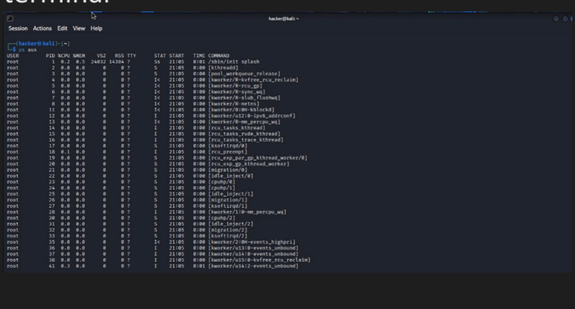


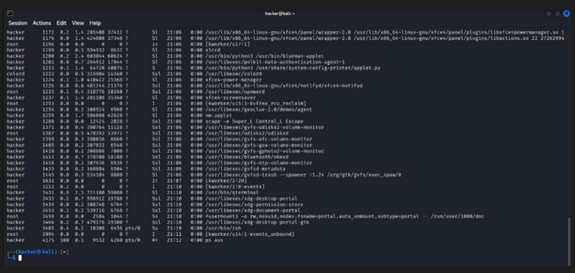
2. ps aux : is a Linux command used to show all running processes on the system.

   a → Show processes of all users

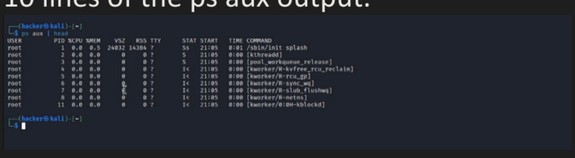
   u → Show processes with detailed info

   x → Show processes not attached to a terminal

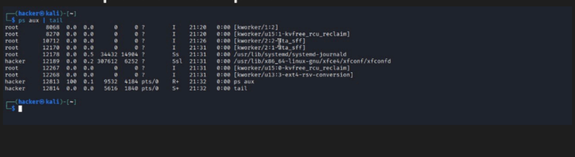




3. ps aux | head- This command shows the first 10 lines of the ps aux output.



4. ps aux tail- This command shows the last 10 lines of ps aux output.



5. pkill- pkill kills a process using its name.

6. killall- killall is similar to pkill but safer and more controlled.
